1. Introduction

This report offers a brief assessment of some of the benefits that are likely to flow from the construction of a next-generation, gigabit-capable communications network in Champaign and Urbana. This report was prepared by CTC Technology & Energy at the request of the Urbana-Champaign Big Broadband Not-for-Profit (UC2B NFP).

The proposed new network will bring state-of-the-art, next-generation infrastructure to the Cities—infrastructure of a sort that is found only in a handful of American jurisdictions. That new infrastructure—and the service it enables—will prove to be a differentiator for the Cities in a range of ways—making them one of an elite few in the United States (with Austin, TX; Provo, UT; and Chattanooga, TN) and positioning them (with Seoul, Tokyo, and Hong Kong) among the most connected cities in the world. We summarize below some of the economic development benefits and innovations that the infrastructure will enable.

In addition to quantifiable economic benefits, offering a next-generation fiber network to the businesses and households of Champaign and Urbana will provide substantial educational, environmental, and health benefits. These “beyond the balance sheet” benefits are not reflected on profit and loss statements, but still represent an important intangible “return” to the communities.

New gigabit networking in Champaign and Urbana will also deliver unquantifiable benefits—a path to the digital future that ensures Champaign and Urbana’s place in the innovation economy.

Technologists have noted that gigabit fiber networks, as they emerge, will “affect our way of working and playing as profoundly as did the telegraph, telephone, railroad and original Internet. A fiber network is an investment that would last 50 years or more.”¹ Fiber—like access to roads and waterways—is a key tool for economic development. Indeed, “while access to those roads and the river is still a huge advantage ... having bandwidth is just as vital for the long-term economy.”²

It is no exaggeration to say that the Internet has changed the way most Americans work, communicate, and live their lives. Almost every personal and commercial activity undertaken by Americans has been changed by the Internet—family communication; social engagement;

¹ Bill Schrier, “The Future Is Fiber,” *Government Technology*. June 3, 2009, at 37 (http://www.seattle.gov/broadband/docs/SeattleFTNBenefits_091109.pdf) (accessed Jan 2, 2014).

² Scott Hilyard, Mar. 5, 2013, *PekinTimes.com*, “Council Approves ITV-3 Franchise” (ITV-3 Vice President, Lev Dinkla, referring to potential economic growth in Peoria) (<http://www.pekintimes.com/article/20130305/NEWS/130309822#ixzz2nZ715JWa>).

gaming; banking; searching for jobs; interacting with government. Even during a time when most users had dial-up or relatively slow cable or DSL broadband connection, the Internet enabled the creation of applications and services that, as recently as 15 years ago, were impossible to imagine.

Now imagine the innovation and possibilities presented by truly high-speed, abundant, unconstrained fiber connectivity. Fully-fiber networks such as that proposed here by UC2B NFP and its private partner hold the promise of expanding on existing innovations and acting as a springboard for innovations that we cannot yet imagine.

2. Background Regarding the Communities' Private Partner

The UC2B FTTH expansion would be owned and operated by iTV-3, a wholly owned subsidiary of Midstates Video Corp. This partnership holds much promise for the network's viability because of Midstates' financial stability and long-term investment strategy, its experience providing FTTH service, and its customer focus.

2.1 Company background

A multi-faceted family-owned organization with operations in 21 states, our observation is that Midstates is a stable and financially successful company that was established and maintains its center of gravity in Illinois. The company's business interests include a video division that operates 779 Family Video stores and a real estate division that controls more than \$550 million of property, including more than 1 million square feet of space leased to third parties.

Midstates Video was founded in Springfield in 1978 by Charles Hoogland as the successor to Charlie's father's Midstates Appliance and Supply Co., which was started in 1946. The company remains a family business; it is not publicly traded. Significantly, for the UC2B project, the company has exhibited a commitment to investing for the long term and has very strong ties to the University of Illinois.

Midstates' Family Video chain—the largest bricks-and-mortar movie and game rental chain in the United States—illustrates the company's long-term strategic planning. While video stores have declined nationally—from 25,000 locations in 2003 to only 17,000 in 2010 and even fewer today³—Family Video has seen growth year-over-year. In fact, Family Video has capitalized on the loss of its former competitors (e.g., Blockbuster and Hollywood Video), establishing retail

³ Steve Tarter, Oct. 14, 2010, *State Journal-Register*, "Family Video launches fiber-optic project in Pekin area" (<http://www.sj-r.com/x1943804835/Family-Video-launches-fiber-optic-project-in-Pekin-area/?tag=1#ixzz2nZKmEBo>) (accessed Dec. 15, 2013).

locations in neighboring areas as they have gone out of business.⁴ Netflix and Redbox are now Family Video's primary rental competitors; to address that competition, Family Video is continuing to "branch[] into complementary businesses" and focusing on customer service (an area where Redbox kiosks cannot compete by design).⁵

Midstates has proven itself to be financially strong in the past, and we believe that it will be a good steward of the UC2B FTTH network. The company has successfully expanded into complementary business lines, including FTTH, and clearly backs up its strategic decisions with committed management and strong focus on localism and customer service.

Based on its track record, it's our view that this is not a company that is trying to build fiber infrastructure just so it can turn around and sell the network for high profit. Midstates appears to be interested in expanding its already significant investment in the community and the state. That makes them a good partner from the standpoint of building a long-term relationship, hiring locally, and creating operational stability.

2.2 Company experience in FTTP

Midstates is not new to fiber-to-the-premises networking—another mark in its favor in terms of operating the UC2B network. iTV-3 was launched following Midstates' acquisition of BitWise Communications; Midstates has reportedly invested \$25 million in expanding the business to date.

iTV-3 began providing fiber services in 2009 with a "test run" to 250 homes in Pekin, Illinois and a commitment to "mak[ing] sure our customer service is flawless" before expanding.⁶ The company is installing fiber infrastructure in Pekin, Morton, and East Peoria, Illinois and is approaching two million feet of fiber installed.

iTV-3 has experienced steady growth since its formation. The company had 14 employees in 2011, 30 by the following year, and 60 at the start of 2013.⁷ It now has more than 70 employees, serves 6,200 residential customers, and averages 90 installs per week. iTV-3 also currently serves more than 700 business customers.

⁴ Tim Landis, Feb. 7, 2013, State Journal-Register, "Family Video president sees continued growth" (<http://www.sj-r.com/x766862973/Family-Video-president-sees-continued-growth#ixzz2nZTUcaTS>) (accessed Dec. 15, 2013).

⁵ TMCNet.com, Aug. 15, 2011, "Chain with Illinois roots still growing after video-rental competitors stumble" (<http://www.tmcnet.com/submit/2011/08/16/5707741.htm>) (accessed Dec. 15, 2013).

⁶ Matt Buedel, Oct. 27, 2009, *Journal Star*, "Comcast Challenger Enters Pekin," (<http://www.pjstar.com/x1768143339/Comcast-challenger-enters-Pekin#ixzz2nZ9TWmp3>) (accessed Dec. 15, 2013).

⁷ Scott Hilyard, March 5, 2013, PekinTimes.com, "Council approves ITV-3 franchise" (<http://www.pekintimes.com/article/20130305/NEWS/130309822/?tag=2>) (accessed Dec. 15, 2013).

By providing “redundant peering” and access to “wholesale purchasing of bandwidth,” iTV-3 guarantees that “[e]very iTV-3 Internet customer will get the bandwidth they signed up for, and no less.”⁸ In the event that speeds do not reach this guaranteed level, iTV-3 provides in-home technical support at no cost to subscribers.⁹ Moreover, because iTV-3 does not require subscribers to enter a long-term contract, the company has an ongoing incentive to keep customers satisfied.¹⁰

2.3 Company focus on customer service

Every indication is that Midstates is extremely focused on service. In each of its business lines, the company makes a commitment to its customers. Its Family Video retail stores prominently feature this unequivocal statement: “Family Video’s mission is to be our customers’ first entertainment choice. We do this by providing a unique mix of great customer service and low prices. Customer Service is our Top Priority!” Given the generally poor reputation of incumbent broadband service providers, this focus on customer service will likely be a competitive advantage for iTV-3, and bodes well for potential customers in Champaign and Urbana.

⁸ Peoria.com, Comments posted by Curt Pehrson, Residential Sales Supervisor, iTV-3 (http://www.peoria.com/mobile/view_message.php?message_board_message_id=&message_board_parent_id=346095&parent_message_id=) (accessed Dec. 15, 2013).

⁹ Peoria.com, Comments posted by Curt Pehrson, Residential Sales Supervisor, iTV-3 (http://www.peoria.com/mobile/view_message.php?parent_message_id=346095&message_board_category_id=&vpage=2) (accessed Dec. 15, 2013).

¹⁰ Peoria.com, Comments posted by Curt Pehrson, Residential Sales Supervisor, iTV-3 (http://www.peoria.com/mobile/view_message.php?parent_message_id=346095&message_board_category_id=0&vpage=3) (accessed Dec. 15, 2013).

Family Video's President, Keith Hoogland, attributes the company's success to its customer service, explaining, that Blockbuster and others "didn't understand the difference between retailing and 'rent-tailing.' 'We're a business that sees customers six times a week. They're used to coming in and out, and they want to be called by their first names.'" In contrast, he explains, their competitors "tried to act like retailers such as Best Buy, where people come to shop once a month."¹¹

iTV-3 explains that its goal is to "marry[] [the] best technology with [a] different view of customer service [from its competitors]."¹² Consistent with this goal, iTV-3 Vice President Levi Dinkla relates that its service representatives are able to stop by and make house calls to help customers troubleshoot the technology.¹³ This is something that would simply not be possible with a national brand. This "view of customer service" originates from the company's history as a retail brand. As it expands into fiber, Dinkla explains, "The real opportunity is in bringing our customer service culture into this business, and treating people right by providing true customer service."¹⁴

Anecdotally, some local online message boards feature multiples exchanges where subscribers complain about the service they have historically received from Comcast and urge one another to transition to iTV-3 when it is available. In one example, a subscriber writes: "I just dropped Comcast and went with iTV-3. More channels, more HD and the 5mb downloads are now 20. The install crew was very professional as well. If it's in your area I suggest you check it out."¹⁵ Another subscriber writes: "iTV3 has been very reliable, and of course super fast. I can load video to the internet in record time. I can stream Netflix at any given time of the day no problem. Dump Comcast asap, you won't look back."¹⁶

Over the past three years, iTV-3 has maintained an A-plus rating with the Better Business Bureau, with no reported complaints.¹⁷

2.4 Company record in Champaign and Urbana

iTV-3 and its parent company have established relationships and holdings in Urbana and Champaign. Family Video has owned real estate and operated a store in Champaign since 1997 and has done so in Urbana since 2003.

In that time, according to iTV-3, Family Video has paid Urbana \$294,554 in real estate taxes and has paid wages in Urbana in the amount of \$1,560,240. Since 2000, Family Video has paid Champaign \$267,979 in real estate taxes and has paid wages in Urbana in the amount of \$2,005,030.

In addition, according to iTV-3, more than 40 percent of Family Video's employees, including managers, in Champaign and Urbana are minorities.

3. Gigabit Network Construction Will Stimulate Economic Activity

Construction of a gigabit network in Champaign and Urbana will create new economic activity. Based on our engineering experience, we estimate that local construction could entail expenditures of as much as \$80 million for construction and deployment of network infrastructure throughout Urbana and Champaign. This investment will have a significant positive economic impact on the Urbana-Champaign economy—ranging from an estimated \$60 million to \$250 million, based on various methodologies.

The Congressional Budget Office (CBO) assigns a multiplier ranging from 1 to 2.5 to “[p]urchasing goods and services—for instance, by funding construction and other investment activities that could take several years to complete.”¹⁸ The multiplier represents the “estimated direct and indirect effects on the nation’s output of a dollar’s worth of a given policy.”¹⁹ Applying a conservative estimate of project costs, expanding the UC2B network would support an additional \$60 million to \$150 million of economic activity.

The Bureau of Economic Analysis (BEA) uses a 2.01 output multiplier for Information-Telecommunications investments, suggesting that every new dollar invested in the telecommunications utility industry in Champaign and Urbana will generate \$2.01 of economic activity. This growth not only includes direct expenditures in the telecommunications industry, but also induced expenditures, including purchases made by employees and money circulated through the economy. Applying the BEA multiplier to the anticipated cost of an expanded UC2B

¹⁸ Congressional Budget Office (CBO), May 2011, Pub. No. 4284, “Estimated Impact of the American Recovery and Reinvestment Act on Employment and Economic Output from January 2011 Through March 2011,” at 1 & 6 (Table 2) (note that Table 2 is limited to “Major Provisions of the American Recovery and Reinvestment Act” and does not explicitly mention broadband deployment. Nonetheless, telecommunications construction can clearly be deemed a purchase of goods and services by the federal government, thus supporting use of this multiplier).

¹⁹ *Id.* at 4.

network (\$60 million to \$100 million) demonstrates that building FTTH will create an additional \$120 million to \$201 million in economic activity.

The Center for Strategic Economic Research, an economic research and consulting group specializing in applied research and strategy development in the regional economics and economic development fields, applies a multiplier of 0.83 to infrastructure and public works projects, including telecommunications construction. Specifically, the Center explains that every \$1 million of public works and infrastructure construction supports an additional \$825,858 of output through indirect and induced activities.²⁰ Applying this model to a UC2B expansion, \$60 million to \$100 million in expenditures will ultimately support an additional \$49.8 million to \$83 million in direct and indirect economic benefits.

4. Gigabit Construction and Operations Will Create Local Jobs

Construction and operation of a gigabit network to homes throughout Champaign and Urbana will directly create a significant number of construction and operations jobs.²¹ More importantly, for long-term economic development, new indirect jobs and economic activity will also result from the capabilities created by new broadband services. While projections of the precise economic effects vary, studies consistently find a positive impact on communities that deploy broadband.

The Communications Workers of America project that each \$1 million invested in broadband creates 20 jobs.²² The U.S. Bureau of Economic Analysis assigns a jobs multiplier of 9.10 for the telecommunications sector.

According to the Bureau of Economic Analysis, nearly one-third of the job creation associated with telecommunications investments are in the Information sector. The next five highest industries by employment impact are professional services, administrative services, retail trade, real estate, and health care.

²⁰ SRR, "Stimulus Calculation Tool: Statewide Economic Impacts of Construction Spending in California" ([82](#)) (applying a 0.83 multiplier to "[a]irport runways, buildings, & related work; arenas, stadiums, & other recreational facilities; bridges, tunnels, & elevated highways; harbor & port facilities; highways, streets, & related work; levee, dam & reservoir construction; mass transit construction; parking facilities; petroleum refineries, chemical facilities, & related work; pipeline construction; power & communication transmission lines; power plants; sewage & water treatment plants; sewers, water mains, & related facilities; solid waste disposal facilities; and water storage facilities").

²¹ Executive Office of the President National Economic Council, "Recovery Act Investments in Broadband," at 12 (<http://www.whitehouse.gov/sites/default/files/20091217-recovery-act-investments-broadband.pdf>) (accessed Jan 3, 2012).

²² Eric Auchard, "The Case for a Broadband Bailout," Reuters (Opinion), Feb 13, 2009 (<http://www.reuters.com/article/reutersComService4/idUSTRE51C2W920090213>) (accessed Nov. 6, 2012).

Studies identify a range of categories of direct job creation from broadband initiatives. First, there is direct labor associated with construction and deployment of the network. This includes the technicians and construction workers who lay the broadband pipes.²³ Second is the category of job growth comprised of the direct labor associated with installing the infrastructure components and equipment that take the fiber to the user location. This includes optical fiber, wireless tower structures, and network electronics.

In the first category of job creation, gigabit construction in Champaign and Urbana will have an immediate impact in the construction and information technology sectors (based on our observations of iTV-3's efforts elsewhere, we anticipate that network deployment will begin quickly and will be complete within approximately four years). In construction, workers would immediately engage in engineering, planning, and environmental compliance. During the intensive construction phase of the next few years, workers will dig ditches and trenches, place fiber in the ground and on utility poles, and build towers for aerial connections. Additional workers will place and configure communications equipment, manage installation, repair towers and lines, and interact with customers. Some of these direct benefits will accrue to workers from outside the community. Nonetheless, these workers will benefit the local economy because they will purchase fuel, eat at local restaurants, and sleep in local hotels.

In the second category of job-creation, deployment of the gigabit network will directly create jobs, primarily in the skilled technology area, as workers install and activate communications equipment and other materials that are essential for operation of the fiber optics. A further category of jobs will be created for such ongoing services as network operations and equipment maintenance.

CTC engineers undertook an independent analysis of likely job creation based on our 30-year experience analyzing, testing, and designing communications networks and on our observations of iTV-3's fiber deployments elsewhere. Our analysis is also based on our direct experience with network projects in other cities that are substantially similar to Champaign and Urbana.

On these bases, we conservatively estimate that at least 84 jobs per year will be created in the construction phase of a Champaign and Urbana build-out and that at least 42 jobs will be created per year in the operations phase for fiber maintenance and network operations.

Our analysis is summarized in the table below.

²³ Robert D. Atkinson, Daniel Castro and Stephen J. Ezell, "The Digital Road to Recovery: A Stimulus Plan to Create Jobs, Boost Productivity and Revitalize America," ITIF Study, Jan 7, 2009, at 2 (<http://www.itif.org/files/roadtorecovery.pdf>) (accessed Dec. 30, 2013).

Table 1: Estimate of Job Creation During Network Implementation and Operations

Item	Unit	Avg. Hours per Unit	Project Scope	Estimated Total Hours	Construction FTEs (4-year buildout period)
Project Management and Quality Control	Miles	110.5	550.0	60,789.7	9.7
Physical Plant Engineering and Permitting	Miles	82.4	550.0	45,310.3	7.3
Construction	Miles	579.1	550.0	318,518.7	51.0
Network Electronics Design and Deployment	Subscribers	4.0	25,000.0	100,000.0	16.0
			Total:	524,618.8	84.1
Operations					
Item	Unit	Annual Hours per Unit	Project Scope	Estimated Hours	Full Time Employees (annual)
Fiber repairs	Miles	20.0	550.0	11,000.0	5.3
Fiber Locates / service drop maintenance	Miles	41.6	550.0	22,880.0	11.0
Customer support and billing	Subscribers	0.50	25,000.0	12,500.0	6.0
Sales/ sales engineers	Potential Sub	4.0	25,000.0	100,000.0	16.0
Network Engineering Support	Entire Network	8,320.0	1.0	8,320.0	4.0
			Total:	154,700.0	42.3

5. Gigabit Networking in Champaign and Urbana Will Narrow the Digital Divide

The proposed network, for all its sophistication and its advanced technology, is positioned not to leave anyone in Champaign and Urbana behind. UC2B NFP’s contract with iTV-3 includes a focus on digital inclusion efforts, including funding from iTV-3 to support UC2B NFP’s efforts. In addition, the emergence of competition as a result of iTV-3’s entry into the Champaign-Urbana market is likely to make some services more affordable. In our experience, the availability of lower costs products is likely to increase broadband use in communities and neighborhoods that have been left behind by the digital revolution.

And the impact of increased broadband adoption can be dramatic for a community and for its economy: The Brookings Institution has measured the marginal value of increased broadband use, concluding that every 1 percent increase in broadband penetration leads to a 0.2 percent to 0.3 percent increase in annual employment growth.²⁴ Similarly, a study by the Sacramento Regional Research Institute found that each 1 percent increase in broadband use triggers 0.075 percent growth in employment and 0.088 percent increase in payroll. Even this modest projection translates to significant gains. The study concluded that a 3.8 percent

²⁴ Robert Crandall, William Lehr, and Robert Litan, “The Effects of Broadband Deployment on Output and Employment: A Cross-sectional Analysis of U.S. Data,” The Brookings Institution, Issues in Economic Policy, July 2007, at 2 (www.brookings.edu/views/papers/crandall/200706litan.pdf).

increase in national broadband use over a decade would result in a cumulative 10-year gain of 1.8 million jobs and \$132 billion in payroll.²⁵

6. Gigabit Networks Attract Population and Businesses

The U.S. cities that have pioneered gigabit networks have seen a documented phenomenon of new population and workers—particularly in high-tech, bandwidth-intensive fields—relocating to those cities. And those new residents and businesses have had the impact of creating new dynamism and development in local economies.

The *New York Times* reports, for example, that in Chattanooga, Tennessee, “‘The Gig’ allowed [the city] to attract capital and talent into this community that never would have been here otherwise.”²⁶

According to the *Times*, since the network was activated four years ago, “the signs of growth in Chattanooga are unmistakable. Former factory buildings on Main Street and Warehouse Row on Market Street have been converted to loft apartments, open-space offices, restaurants and shops. The city has welcomed a new population of computer programmers, entrepreneurs and investors. Lengthy sideburns and scruffy hipster beards—not the norm in eastern Tennessee—are de rigueur for the under-30 set.”

“This is a small city that I had never heard of,” said Toni Gemayel, a Florida native who moved his software start-up, Banyan, from Tampa to Chattanooga because of the Internet speed. “It beat Seattle, New York, San Francisco in building the Gig. People here are thinking big.”

Similarly, in Wilson, North Carolina, “the city focused its ‘Greenlight’ gigabit beam on its local business incubator, the Upper Coastal Plan Business Development Center,” to attract high-tech entrepreneurs.²⁷

In Kansas City, Google Fiber’s residential network provides substantial economic benefits to area startups, which operate out of people’s homes. Attracted by the high Internet speeds, low cost of living, and high quality of life, Google Fiber has served as a “lightning rod” that draws

²⁵ “Economic Effects of Increased Broadband Use in California,” Sacramento Regional Research Institution, Nov. 2007 (http://www.srri.net/AboutUs/EconEffectsBB_Research.pdf).

²⁶ “Fast Internet is Chattanooga’s New Locomotive,” *New York Times*, Feb. 4, 2014, http://www.nytimes.com/2014/02/04/technology/fast-internet-service-speeds-business-development-in-chattanooga.html?_r=0 (quoting Sheldon Grizzle, founder of the Company Lab, which helps start-ups refine their ideas and bring their products to market).

²⁷ “What it Means to Be A GigCity: Wilson Incubating Small Businesses,” SEATO listserv posting, Feb. 7, 2014.

people to the community.²⁸ As young entrepreneur Nick Budidharma (who came to Kansas City from Hilton Head, South Carolina) explains, “It’s hard to develop a business when you have to think about the cost of Internet and speeds.” In Kansas City, however, “You don’t even have to consider it.”²⁹

Google’s new infrastructure has served as an entrepreneurial “catalyst,” creating “a ripple effect of entrepreneurial activity,” according to Lesa Mitchell, a vice president at the Kauffman Foundation, the leading nonprofit supporting entrepreneurial activity.³⁰

Kansas City local Ben Barreth liquidated his retirement savings and purchased a home in one of the area’s first “fiberhoods” to create “Hacker House.” Barreth offers access to Google’s 1 Gbps service and rent-free accommodations for three months while entrepreneurs develop innovative broadband applications.

The availability of fiber is attracting knowledge workers to Kansas City from other parts of the country. Mike Demarais moved from Boston to develop Handprint, a 3D-printing software company.

Two dozen startups have taken up residence in a former industrial area known as Kansas City StartUp Village (KCSV). Mike Farmer, founder of mobile search app Leap2.com, reports that he meets several people that are looking to move to Kansas City every week.³¹ While there have always been a handful of innovators in the area, the growth has been dramatic with the advent of Google Fiber. A weekly gathering for hopeful entrepreneurs historically attracted a dozen people. That same gathering “recently attracted a standing-room-only crowd of 260 businesspeople, investors and city officials.”³²

The growing density of start-ups is a key element of Kansas City’s success. These pockets of innovation are growing around Google’s “fiberhoods.” Kansas City Startup Village, for instance provides a “concentrated and collaborative area of startups.” Today, the Village is comprised of 24 technology-based startup companies residing in three neighboring houses.³³

²⁸ Mike Stanton, July 2, 2013, The Collegian, “Google Fiber leads to technology hotbed in Kansas City” (<http://www.kstatecollegian.com/2013/07/02/google-fiber-leads-to-technology-hotbed-in-kansas-city/>) (quoting Adam Arredondo, cofounder of an interactive community events website).

³³ Visit <http://www.kcstartupvillage.org/villagers/startups/> for a list of KCSV startups to date.

The same phenomenon has been noticed in Lafayette, Louisiana, which operates a public gigabit network. Pixel Magic, a special effects studio, built an office in Lafayette to support its work while making the movie “Secretariat,” which was filming nearby. The LUS Fiber connection allowed the studio to be so productive that it ultimately established a permanent office in the community, providing 100 to 200 full-time jobs. The company acknowledged the existence of the network supported its decision: “The fact that we have the high-speed Internet between here and there is a big plus so we can show the clients the work in progress—production companies and studios.”³⁴

Pixel Magic’s experience is not unique. The high-speed and low-cost network prompted Scott Eric Olivier, owner of the tech startup firm Skyscraper Holding, to relocate to Lafayette from Los Angeles.

These economic development trends led the Bureau of Economic Analysis to rank Lafayette, Louisiana the “sixth-fastest growing economy in the nation in September 2011,” with substantial growth in median household income during the period the network was launched. “Though much of Louisiana has benefited from its oil and gas resources during the recession, it was Lafayette that grew the fastest.”³⁵

Launched in 2001, Bristol Virginia Utilities (BVU) OptiNet provides telecommunication services to nearly 12,000 subscribers in Southwest Virginia (near the Tennessee border). The network “has fundamentally changed the economic face of Southwest Virginia.”³⁶

In 2007, BVU prepared a report laying out the economic benefits of its investment in broadband. The report documented over \$50 million in new private investment, generating 1,220 jobs in seven counties and \$37 million in annual payrolls. Subsequent analysis was even more positive, attributing over 2,000 well-paying jobs to the network.

The network has prompted businesses to locate and expand in the community. Northrop Grumman and CGI (a global IT and business process services firm) have created approximately 700 jobs that pay roughly twice the average weekly wage in the community. Both companies

³⁴ Christopher Mitchell, April 2012, Institute for Local Self Reliance, “Broadband At the Speed of Light: How Three Communities Built Next-Generation Networks,” at 30 (available online at <http://www.ilsr.org/wp-content/uploads/2012/04/muni-bb-speed-light.pdf>).

³⁵ *Ibid.*

³⁶ Masha Zager, *Broadband Properties*, “Municipal FTTH Deployment Snapshot” (<http://www.bbpmag.com/snapshot/snap1002.php>).

“attributed a part of their location decision to the fact that they can get redundant broadband service with both Verizon and OptiNet in the area.”³⁷

The network has also enabled DirecTV (a partial competitor) to operate a virtual call center in Bristol. One hundred Bristol residents provide technical support to the company’s 25 million customers throughout the United States and Latin America.

OptiNet has not only led businesses to locate and expand in the region, but has also discouraged others from leaving. For instance, coal producer Alpha Natural Resources decided to maintain its headquarters in Bristol, despite merging with a company in the Washington, D.C.–Baltimore area. In 2010, the company began construction on a \$21 million corporate headquarter in the community. OptiNet allows the expanded company to readily communicate remotely with others.³⁸

To ensure that future opportunities continue to benefit Bristol residents, the nearby University of Virginia’s College at Wise created an undergraduate software engineering program in partnership with Northrop Grumman and CGI. The University is also managing a new Technology Development Center, which was launched in a former shopping center.³⁹

Chattanooga suffered a manufacturing decline in the 1980s but is currently the state’s fastest growing community. Much of this growth can be attributed to Chattanooga’s robust fiber network, which is among the fastest in the nation.

The Journal of Applied Business Research has found that the Chattanooga network could generate over \$350 million in social benefits and over 2,600 jobs in its first decade. These include 683 direct jobs and roughly three times that number indirectly. The economic benefits are attributed to increased tax receipts from job growth that is supported by the network.

³⁷ Cathy Swirbul, March-April 2007, *PublicPower*, American Public Power Association, “Broadband Boosts Economic Growth in Bristol” (<http://www.publicpower.org/Media/magazine/ArticleDetail.cfm?ItemNumber=18918>).

³⁸ Christopher Mitchell, April 2012, Institute for Local Self Reliance, “Broadband At the Speed of Light: How Three Communities Built Next-Generation Networks,” at 15, <http://www.ilsr.org/wp-content/uploads/2012/04/muni-bb-speed-light.pdf>; see also Don McGee, May 12, 2010, TriCities.com, “Alpha Natural Resources holds groundbreaking for new headquarters” (for more background on merger and local employment benefits) (http://www.tricity.com/news/article_b77a8f24-7112-51e7-847e-23fa74a848ea.html).

A more recent analysis was even more optimistic, projecting “3,600 jobs and more than \$580 million in economic value over the first 10 years.”⁴⁰ The Chattanooga Chamber of Commerce reports that interest in the community is the highest it has been in three decades. In January 2011, *Business Facilities Magazine* ranked Chattanooga as the top U.S. metropolitan area for economic growth potential.⁴¹ Much of this growth can be attributed to the low cost of fiber—particularly relative to other communities.⁴²

In 2008, Volkswagen announced plans to invest \$1 billion to build its North American manufacturing headquarters in Chattanooga,⁴³ selecting this location from nearly 400 alternatives that were considered nationwide.⁴⁴ The facility supports 2,000 jobs for area residents and uses EPB’s fiber services in its downtown office.⁴⁵

Amazon is among Chattanooga’s most notable new employers. In 2011, the company chose to locate its one-million-square-foot distribution center in the city, a move that initially generated 1,400 full-time jobs and an additional 2,000 seasonal positions. Last year, the company reported that it was employing over 2,000 workers, with plans to expand and add hundreds of additional positions.⁴⁶

Fiber not only supports large-scale businesses, but inspires innovation for entrepreneurs who “are flocking to Chattanooga.”⁴⁷ Virtually unlimited bandwidth “allows individuals to pursue dreams of starting sole proprietorships from their homes.”⁴⁸ These dreams are launched by Lamp Post, a new venture capital firm in Chattanooga, which relies on the fiber network to help emerging companies build their businesses. The firm is credited with assisting in the creation of 50 new jobs in the latter part of 2011 alone.⁴⁹

7. Gigabit Networks Enable Economic Benefits Such as Enhanced Credit Ratings and Increased Property Values

Next generation broadband is increasingly recognized as a differentiator for a city's economic outlook. Credit rating agency Fitch, for example, recently cited the construction of Google Fiber as one factor in its decision to upgrade Kansas City, Missouri's credit rating, thus lowering the city's cost of borrowing. Fitch noted:

Kansas City is a host city for Google Fiber, which is an ultra high-speed broadband network up to 100 times faster than current broadband. The network is already attracting a number of smaller internet and data companies to the city and has the potential to make a significant economic impact.⁵⁰

New gigabit-capable networks also create economic value in ways that benefit citizens of the community. For example, researchers have documented increased sale and rental values for homes with direct fiber connections, both in the United States and in Europe. According to *Broadband Communities Magazine*, "access to utilities makes private property more valuable, and FTTH is among the utilities that owners and renters especially value."

Indeed, direct fiber connections make "single-family homes easier to sell and multiple dwelling units easier to rent." The magazine cites a recent survey by RVA LLC that documents that home and condominium buyers will pay a 2 percent premium for a fiber-connected home and renters will pay a 15 percent premium.⁵¹ This phenomenon has also been documented in Kansas City, where Google Fiber to homes is attracting businesses to those residences and increasing property values.⁵²

8. Gigabit Construction Will Enable the Benefits of Competition

"Competition is the main driver for improved services"⁵³ in the broadband market, according to the leading broadband analysts in the United States. And the entry of a new provider into a community ripples in positive ways through the market.

Google Fiber's entry into a few local markets has been the most well publicized example of new fiber-based competition over the past few years. The incumbent cable and telephone

⁵⁰ "Fitch revises Kansas City, Mo. outlook to stable, ratings affirmed," Reuters, February 11, 2013, <http://www.reuters.com/article/2013/02/11/idUSWNB0032L20130211>.

⁵³ Julie Sartain, "Google's Gigabit Internet: Not coming to a neighborhood near you," quoting Ian Keene, Research Vice President, Gartner. *Network World*, Nov. 19, 2013, <http://www.networkworld.com/news/2013/111913-google-internet-275938.html?page=1>

companies' initial responses have been fairly uniform in those cities: They have begun to offer faster service and more competitive prices.

- In Kansas City, Kansas, Time Warner Cable and AT&T have begun “bidding against Google to wire firms and city buildings with equally high-octane Internet.” Time Warner bid for a contract to wire a new city-sponsored start-up incubator with gigabit speeds. City officials speculate that the bid was motivated by competition from Google Fiber—and note that this was the first time they had been approached by Time Warner in six years.⁵⁴
- Following Google Fiber’s rollout in Kansas City, Kansas, the state “saw the largest jump in average Internet connection speeds of all U.S. states” for the quarter—a result attributed to the increased speeds Time Warner began offering to its subscribers there.⁵⁵
- In Austin, Texas, AT&T announced that it would roll out its own gigabit fiber network in the city about six months after Google announced its plans.⁵⁶ The company then declared that the GigaPower service had “officially launched”—noting that residents “can influence future deployment by voting for your neighborhood” on the company’s website.⁵⁷

In neither city has the incumbents’ pricing matched Google’s monthly fee (which, at \$70, has been described as “dirt cheap”),⁵⁸ although AT&T does promise a “free upgrade to speeds up to 1 Gbps in 2014” for Austin customers who sign up for its 300 Mbps service at the same \$70 price.⁵⁹

Looking to the future, however, one industry analyst has posited that the effects of Google’s competition in these markets may lead to better pricing not just in Kansas City and Austin, but in many other cities as well. “All [Google] has to do is introduce [Fiber] to a few selected

markets and then watch how the cable operators in those markets respond. If they drop their prices to compete with the ultrafast, ultracheap Fiber, they'll have to do the same in other markets or else face uncomfortable questions from regulators about why they charge more in cities where they face less competition.”⁶⁰

Even where the national media spotlight is not shining—specifically, in communities where municipal governments and utilities have built FTTH networks—incumbents faced with new competition have followed a similar script and increased their speeds, lowered their prices, or both.

In Tacoma, Washington—about 30 miles south of Seattle—the open access Click! Network operated by the municipal utility enables three Internet service providers (ISP) to offer broadband download speeds up to 100 Mbps.⁶¹ Comcast offers a similar service in Tacoma, Seattle, and other nearby communities, and at a published rate that is significantly less than the lowest Click! Pricing (\$115 per month versus \$170).⁶²

In Burlington, Vermont, Comcast offers 105 Mbps downstream service for \$90 per month and 50 Mbps downstream service for \$60 per month. Both prices undercut the local municipal network, Burlington Telecom, which offers 100 Mbps downstream service for \$110 monthly and 50 Mbps downstream for \$85 monthly.⁶³

Notably, Comcast's 105 Mbps downstream connections in Tacoma and Burlington are much faster than the 50 Mbps service the company offers as its highest tier in many other markets, including Champaign and Urbana.⁶⁴

In another region of the country, Lafayette Utilities System (LUS) Fiber created competition for Cox Communications, the incumbent service provider, when it built an FTTH network in Lafayette, Louisiana. By February 2012, LUS Fiber had reportedly captured nearly one-third of Lafayette's 45,000 residential and business subscribers. LUS Fiber Director Terry Huval noted that, to compete, Cox “slashed its rates for some residents and business customers, lowering TV

⁶⁴ Reardon

and Internet bills across the city.”⁶⁵ In this way, the network has benefited subscribers and non-subscribers alike.

This increased competition has had substantial economic benefits for Lafayette. LUS estimates that the fiber system created \$250,000 in savings in 2009, over \$4 million in 2010, and \$5.5 million in 2011. The Utility projects a total savings ranging between \$90 million and \$100 million over the project’s first decade.⁶⁶

9. Gigabit Fiber Networks Create Educational Benefits

Adequate broadband enables a range of educational applications. In addition, it is absolutely necessary to enable some core educational functions. Champaign and Urbana already have advanced infrastructure to schools, which facilitates these advances in the classroom. Extension of fiber to the home (and service that most Champaign and Urbana families can afford) would mean that such educational opportunities would not abruptly terminate at the classroom door. Indeed, as robust networks to the schools expand resources in the classroom, home connectivity remains “the major unresolved issue for technology directors.”⁶⁷ As school Internet use becomes more pervasive, this disconnect will become increasingly pronounced. This is particularly true with the growing popularity of one-to-one computer programs, cloud computing, electronic textbooks, and flipped classrooms. The new gigabit network will enable Champaign and Urbana students to access these resources at home.

America’s classrooms are migrating to one-to-one computer programs (also known as “ubiquitous computing”), whereby each student and teacher has one Internet-connected wireless computing device for use both in the classroom and at home. A 2006 survey found that 31 percent of superintendents are implementing ubiquitous computing in at least one grade, up from an average of 4 percent. Moreover, over 75 percent of superintendents recognized the potential benefits of one-to-one computing, agreeing with the statement that “ubiquitous technology can reduce the time, distance, and cost of delivering information directly to students and that teachers can spend substantially more one-on-one time with each student and personalize the education experience to each student’s needs.”⁶⁸

⁶⁷ “America’s Digital Schools 2006: A Five-Year Forecast, 2006,” at 19 (http://www.k12hsn.org/files/research/Online_Learning/ADS2006KF.pdf).

⁶⁸ “America’s Digital Schools 2006: A Five-Year Forecast,” The Greaves Group and The Hayes Connection, at 15 & 18 (http://www.k12hsn.org/files/research/Online_Learning/ADS2006KF.pdf) (accessed Dec. 31, 2013).

By 2007, 78.7 percent of U.S. school districts reported moderate to significant improvement in one-to-one computing programs,⁶⁹ with potentially significant benefits for student learning. The 2006 America's Digital Schools report found that one-to-one computing programs correlated with increased student retention and attendance, improved writing skills, and reduced disciplinary problems.⁷⁰ As Michael Davino, Superintendent of Schools in Springfield, New Jersey explains, "[a] wireless laptop program provides up-to-date information, access to virtual experiences, instant feedback, individualized attention for all learning styles, student independence, and constant practice. And it's highly adaptable to individual, small group, or whole class instruction."⁷¹

To be effective, however, these devices need to be usable at home. Indeed, "[p]eople increasingly expect to be connected to the Internet and the rich tapestry of knowledge it contains wherever they go."⁷² The portability of mobile devices (including smart phones and tablets) allows just that—as long as there is adequate Internet access. Consequently, a growing number of schools have turned to tablets as a "cost-effective strategy for one-to-one learning," which can "support learning in and outside of the classroom."⁷³ As one-to-one computing allows students to take computers out of the classroom, FTTH will provide the technological resources to help them extend the school day and continue their lessons.

A recent report by the New Media Consortium⁷⁴ assesses six technologies along three adoption horizons that indicate their anticipated entrance into mainstream use for teaching. Near-term (immediate) technologies include cloud computing and mobile learning. Over the next two to three years, NMC anticipates growing use of learning analytics and open content. And over a "far-term" (four to five-year horizon), NMC anticipates an increased use of 3D printing and virtual and remote laboratories. While these technologies are applied directly in the K-12 setting, they will be more successful if applied outside the boundaries of the school.

The benefits of unbounded connectivity are evident in the use of cloud-based services at Hobart Middle School in Indiana. There, teachers use Google Drive, Facebook, and Twitter to allow students to keep up with their classwork and engage with the classroom from home. These tools have allowed teachers to provide students with real-time feedback, even when

they are outside the classroom. Eighth grader Jessica Macias experienced the benefits of this “virtual classroom” when she recently missed a day of school due to illness. She was able to log into her social studies class from home using Google Apps. By accessing the cloud, Macias was able to view the assignment and agenda and observe her teacher’s lecture as a slide show. She was able to observe the other students using the system in real time as well. As a consequence, Macias could return to school the following day without having missed any work.⁷⁵

Hobart Middle School is not unique. In fact, 42 percent of K-12 schools and organizations surveyed by CDW-G report that they are “currently implementing some form of cloud computing solution.”⁷⁶

Electronic textbooks are becoming increasingly common and will likewise require high-speed Internet access at home to access their content. The Federal Communications Commission has already challenged the private sector to enable electronic textbooks (and the elimination of printed material) by 2015.⁷⁷ Without adequate broadband at home, students will be unable to access the textbooks required for learning.

“Flipped classrooms” are another emerging educational trend that demand high-speed Internet access for all students. A flipped classroom inverts the traditional structure of a classroom, such that students listen to a pre-recorded lecture *before* class and perform other learning activities in class. This approach uses “educational materials on the Internet as a primary content strategy.”⁷⁸ By exposing students to material before class through videos and podcasts, they are able to attain deeper knowledge during class when they have access to their teachers and can engage collaboratively with their peers.⁷⁹ By reviewing the videos in advance, students enter the classroom more prepared and able to do the more important work alongside their peers and instructors. Classroom time is preserved “to refine mastery with

discussions, collaborations with classmates, problem solving, and experimentation.”⁸⁰ Teachers who have adopted this approach report that it offers “greater control of material and more face time with students.”⁸¹ Stacey Roshan, a teacher at the Bullis School near Washington, D.C., explains that this approach has allowed her to complete the formal lectures for her AP Calculus course a month in advance, providing extra time for review in the classroom. Because lectures are recorded, students are able to re-watch lessons—replaying confusing sections that “didn’t really sink in” initially. As a result, Roshan reports that the number of students scoring a perfect “5” on the AP exam has risen.⁸² The approach has received considerable support, prompting President Obama to highlight “flipped” classrooms as a component of his plan to make college more affordable.⁸³

Champaign County is home to the University of Illinois Urbana-Champaign, one of the nation’s premier research institutions. The University supports 44,520 students and 10,349 faculty and staff.⁸⁴ While the campus itself is connected to the UC2B fiber ring, the full benefits that broadband affords will not be realized if students and faculty are not able to retain access when they return to their homes. Notably, less than 25 percent of University of Illinois students live in university-owned campus housing. Many others live in off-campus apartments, which provide Internet connectivity, but do not support high-bandwidth applications. The lack of access to affordable, high-speed broadband creates a digital divide for those students who live off campus and are not connected. While faculty are eager to put more course content online and reduce the demand on classrooms, this cannot be done absent certainty that all students have equal access to media-rich, bandwidth-intensive instructional materials. In 2012, only 3.8 percent of courses were taken online.⁸⁵ FTTH could help realize this untapped potential.

⁸⁰ Johnson, L., Adams Becker, S., Cummins, M., Estrada V., Freeman, A., and Ludgate, H. (2013). *NMC Horizon Report: 2013 K-12 Edition*. Austin, Texas: The New Media Consortium, at 10.

10. Gigabit Fiber Networks Enable Environmental Benefits and Cost Savings Through Telecommuting

“Universal, affordable, and robust broadband” is a “necessary prerequisite” for telework.⁸⁶ This is often touted as the “most transformative”⁸⁷ and “biggest environmental benefit”⁸⁸ of new fiber networks. In market research conducted by CTC in San Francisco, 67 percent of respondents reported that they needed higher speeds than cable modem to telework and 70 percent of respondents indicated that they would telework more if there were sufficient speed. Other studies support this finding. [W]orking from home—either as a telecommuting employee or a home-based entrepreneur—is thus far more feasible with FTTH than with other types of broadband connections.⁸⁹

Telework confers a wide array of primary and secondary benefits, which will provide significant cost savings to the residents of Champaign and Urbana by reducing vehicle-operating expenses, the amount of time spent traveling, road repairs, and traffic congestion. In addition, by decreasing mileage driven and gasoline burned, telecommuting benefits the environment and reduces greenhouse gases by lowering auto emissions. Where telework occurs full time, it can reduce construction demand for office space and related electricity use.⁹⁰

There are currently 97,024 individuals over 16 in the workforce in Champaign County.⁹¹ Of these, roughly 4.7 percent (4,572 individuals) telecommute and 68 percent (65,962) travel to work alone by car.⁹² These individuals commute an average of 17.2 minutes each way.⁹³ While shorter than the national average (25.7 minutes), this nonetheless represents a substantial amount of unproductive time each year for Champaign County residents. Indeed, Champaign County telecommuters avoid an average of 34 minutes of driving time each day and nearly

⁹³ *Id.*

three hours each week. If FTTH allowed a doubling of telecommuting in Champaign County (i.e., from 4.7 percent to 9.4 percent), it could conceivably save more than 13,106 hours for area residents.

This avoided commuting time has a direct economic value. Most time spent commuting is of limited or no productivity. It reduces the amount of time Champaign County residents can spend with family, work on household projects, or learn new skills. The 2012 Urban Mobility Report values these “alternate” activities at \$16.79 per hour.⁹⁴ Applying this value to Champaign County, doubling telework in the area would represent in excess of \$220,056 in annual savings for the 4,572 individuals who are able to eliminate their commute.

These individuals would also save money on avoided fuel and vehicle costs. The 2012 Urban Mobility Report indicates that in typical “small cities” (defined as those with populations below 500,000),⁹⁵ commuters cumulatively wasted 5,586,000 hours, 2.7 million gallons of fuel, and \$123 million in 2011.⁹⁶ In these cities, the typical commuter wasted 23 hours, 11 gallons of fuel, and nearly \$500 in 2011.⁹⁷ Since 68 percent of Champaign County’s 65,962 workers travel to work alone by car, allowing an additional 4,572 individuals to work from home would potentially remove 3,109 cars from the road. Applying the Urban Mobility data for small cities as an estimate, these commuters could collectively save 34,199 gallons of fuel and \$1.55 million.

An increase in telecommuting not only saves times for the residents who are no longer driving to work, but also reduces congestion for the remaining members of the workforce. While data does not exist for road congestion in Champaign County, the 2012 Urban Mobility Report indicates that “small cities” have a “Travel Time Index” of 1.11.⁹⁸ Thus, it takes 11 percent longer to reach destinations during peak travel time in these areas. Increasing telework would reduce the number of cars on the road during peak travel times, alleviating congestion. Assuming that 52.5 percent (1,554) of Champaign County’s 3,109 new teleworkers who

previously travelled by private car would have travelled during peak times,⁹⁹ a doubling in telework would lead to a 2.4 percent reduction in private vehicle use during the morning commute.

11. Gigabit Fiber Networks Support Workforce Participation for Seniors and the Disabled

Seniors represent a sizable and growing percentage of the workforce. According to the U.S. Census and the Bureau of Labor Statistics, 14.8 percent of seniors (ages 65 and up) were working or looking for work in 2005.¹⁰⁰ These numbers are projected to increase given the state of the economy, which has affected retirement savings; trends away from defined pension plans; and longer life expectancies, which increase the amount of savings required to sustain a constant quality of life into retirement. According to the Social Security Administration's Actuary Office, delayed retirement is expected to increase the U.S. labor force by one million additional workers by 2030 (1.5 percent by 2080). Several more ambitious analyses by the Urban Institute project an additional 6.2 million workers (4.4 percent by 2040). Assuming that the midpoint of these estimates can "plausibly" be "attributed to broadband technology," Litan projects an increase of roughly 3.6 million workers (roughly 2 percent of the total workforce) by 2030.¹⁰¹ Working seniors earned a median income of \$29,000 in 2005. Assuming comparable earnings for the additional members of the workforce, Litan projects additional output gains of \$122 billion in 2010 and \$822 billion in 2030.¹⁰²

According to the Champaign County Regional Planning Commission, in 2010 there were 96,826 employed individuals in Champaign County.¹⁰³ If broadband access were to enable more seniors to stay in the workforce—leading to a 2 percent increase in the overall workforce—Champaign County would have 1,937 additional employees and, assuming a per capita income of \$24,553,¹⁰⁴ roughly \$47.6 million in additional annual output.

Likewise, if broadband access were to enable a 1 percent increase in employment among Champaign County residents with disabilities, the region would see a fairly substantial level of increased economic output. According to the U.S. Census, in 2012, there were 7,857 residents aged 18 to 64 with disabilities in Champaign County. Using Litan's assumption that FTTH

enabled even 1 percent of these disabled individuals to enter the work force and a per capita income of \$24,553,¹⁰⁵ output would increase by \$1.9 million.

12. Gigabit Fiber Networks Facilitate “In-Sourcing” of Jobs

Millions of American jobs have been outsourced—or “offshored”—to companies abroad. By some estimates, half of the Fortune 500 companies have exported jobs overseas with projections that an additional 3 million jobs will be sent overseas by 2015.¹⁰⁶ Offshoring provides access to low-cost labor, the ability to continue operations 24 hours per day, and an entry into the global marketplace. At the same time, offshoring limits quality control and may compromise customer relations. This, in turn, has led some to explore ways to retain business in the United States. One mechanism is through the creation of virtual domestic call centers, a practice called “homeshoring.” Broadband is a necessary prerequisite for successful homeshoring.¹⁰⁷

Homeshoring offers a range of benefits. Significantly, homeshoring creates opportunities for individuals who would otherwise be excluded from the workforce, since the elderly, disabled, and parents of young children can work as agents from a home office. As a consequence, homeshore agents are often a “higher caliber” than those attracted to a “traditional call center environment.” For instance, one provider reports that the average age of its agents is 38 and 80 percent have received some college education.¹⁰⁸ Companies also benefit from reduced costs, since they do not need to provide security, heat, light, or office space.¹⁰⁹ These savings are significant. In fact, the American Consumer Institute estimates that home-based agents reduce

¹⁰⁵ Champaign County Regional Planning Commission, 2012 Champaign County Statistical Abstract, at 34 (Table 24) (http://www.ccrpc.org/dev/2012stats/SA2011_050712.pdf) (accessed Dec. 11, 2013).

Schelmetic, “A Victory For The Home Agent Business Model,” TMC News, Jan. 20, 2006 (available online at <http://www.tmcnet.com/news/2006/01/20/1302729.htm>); Theresa Sweeney, “Remote Call Centers,” All Business, Jun. 1, 2006 (abstract available online at <http://www.allbusiness.com/technology/telecommunications-phone-systems-voip/4092765-1.html>).

call-center employee costs by more than one-third.¹¹⁰ Office Depot projected that its domestic call center would result in \$15 million annual savings.¹¹¹ Homeshoring even offers savings over offshoring. Indeed, the Telework Coalition asserts that homeshoring can reduce property and IT costs by as much as 80 percent over offshoring.¹¹² Research also suggests that homeshoring improves employee satisfaction, dramatically improving retention and increasing productivity by 10 to 20 percent.¹¹³

Jet Blue Airlines is one of the best known, and perhaps most successful, homeshoring case studies. The New York-based airline has relied exclusively on home-based agents in its virtual reservation center in Salt Lake City, Utah since the company was launched in 2000. The company employs 1,500 home-based agents, the majority (70 percent) of which are part-time, stay-at-home moms. Although all “crew members” work from a home office in Salt Lake City, they are required to report monthly to a brick-and-mortar reservation center to meet with team supervisors and bimonthly for ongoing training. Unlike many homeshoring models, Jet Blue offers its staff medical coverage and profit sharing as well as flight benefits. The flexibility afforded by the company’s home-based operation allows it to benefit from a demographic that would otherwise be unable to enter the workforce, lowering costs and turnover and improving employee satisfaction.¹¹⁴

Other companies offer variations on the Jet Blue model. For instance, many home-based models forego face-to-face interactions, allowing employees to complete training online, either through independent programs or real-time interactions with another virtual agent. While some companies follow Jet Blue’s approach of employing specialized agents to work for dedicated clients, others allow agents to complete training for dozens of different clients simultaneously. Many offer a range of employee benefits, including supplemental health

benefits and paid training, although others cut costs further by treating agents as contractors, thus saving on health care.¹¹⁵

These benefits can easily be enabled through FTTH. Agents must also have a quiet room to conduct business, a separate phone-line, and a personal computer (which may or may not be provided by the employer). The “host” corporation can use its existing Voice over Internet Protocol (VoIP) technology to monitor performance. Agents can interact with one another in online chat rooms set up by the parent corporation, creating a “virtual watercooler.”

Like many cities, Urbana and Champaign could conceivably entice a company to establish a virtual call center if it had FTTH and the right mix of other attributes (e.g., attractive tax rates, workforce availability, suitable office space for training or meeting centers). In fact, Virginia’s Bristol Virginia Utilities (BVU) fiber network led one of the network’s competitors (DirecTV) to create a virtual call center employing 100 operators in the community. This decision could not have been made absent the “robust and reliable connectivity” afforded by BVU’s fiber.¹¹⁶

With its highly educated population, Urbana and Champaign may have an advantage over some other urban areas; Champaign County residents are 50 percent more likely to have earned a bachelor’s degree or higher than the U.S. population as a whole.¹¹⁷ Moreover, the large student population might provide a workforce with flexible hours, which is well-suited to such employment. The city’s location in the central time zone could also be a benefit. Call center employees working a standard day, for example, could provide coverage of “evening hours” for customers phoning from the East Coast, as well as regular business hours for West Coast.

Independent of these economic benefits, telework would be a particularly attractive option for another group unique to communities like Champaign and Urbana—the “trailing spouses” who move to the area to accompany a partner who has been offered employment at the University. These individuals are often left commuting long distances or giving up their jobs altogether. A robust FTTH network increases the opportunity for those workers to retain their jobs or reduce travel time through telework.

¹¹⁵ Martha Frase-Blunt, “Call Centers Come Home,” HR Magazine, Jan. 2007 at 84 (available online at http://www.charitytimes.com/pages/ct_features/june08/articles/ct_june08_feature1_the_home_connection.htm) (describing each of these models).

¹¹⁷ Compare U.S. Census Bureau, 2005-2007 American Community Survey 3-Year Estimates, http://factfinder2.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS_11_5YR_DP02 (reporting that 42.1 percent of Champaign County residents have a bachelor’s degree or higher) with http://factfinder2.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS_11_5YR_DP02 (reporting 28.2 percent of the United States population has attained a bachelor’s degree or higher).

13. Gigabit Fiber Networks Offer Health Care Benefits

In 2006, national health care costs grew 6.7 percent to \$2.1 trillion, or \$7,026 per person, and accounted for 16 percent of gross domestic product (GDP). Similar growth is projected to continue until 2017, at which point it will account for nearly 20 percent of GDP.¹¹⁸ Some of this expense can be attributed to the inappropriate reliance on costly hospital emergency rooms, which are often sought after traditional office hours or in communities with a shortage of physicians. In fact, over half (55 percent) of the 114 million emergency room visits each year are for non-emergencies, accounting for nearly “\$31 billion annually, or \$300 per American household.”¹¹⁹

High-speed broadband technology can dramatically reduce these expenses by providing the tools to remotely monitor patients, allow collaboration between medical professionals, facilitate the transfer of medical data and images, and increase access to emergency services in remote areas.¹²⁰ By one estimate, these services can lead to savings of \$165 billion per year.¹²¹ “Always-on broadband” is “essential” for some of these applications and greatly improves others that “depend on uninterrupted real-time transmission.”¹²²

Telehealth holds particular promise for remote monitoring of chronic conditions. Nearly half of Americans (45 percent or 130 million people) suffer from at least one chronic condition, such

as arthritis, asthma, cancer, depression, diabetes, heart disease, and obesity. Combined, treatment of these conditions accounts for 75 percent of health care spending—\$1.7 trillion annually.¹²³ Despite this enormous expense, most Americans with chronic conditions suffer from inadequate treatment. For instance, according to the National Center for Policy Analysis, less than one-fourth of patients with high blood pressure control it adequately. Twenty percent of patients with Type-1 diabetes fail to see a doctor annually, with 40 percent of diabetics failing to regularly monitor their blood sugar level or receive recommended annual retinal exams.¹²⁴ Inadequate monitoring can have deadly consequences: chronic illness accounts for 70 percent of deaths in the United States.¹²⁵

Figure 1: Physicians Believe Chronic Conditions Are Among their Biggest Health Challenges¹²⁶

Notably, a large majority (64 percent) of those with chronic medical conditions have Internet access, and 53 percent of adults suffering from chronic conditions have already looked online for health information.¹²⁷ Through remote monitoring, these connected Americans can manage and address their chronic illness at dramatically lower cost. In fact, both the Benton Foundation and the University of Texas estimate that remote monitoring could lower hospital, drug and out-patient costs by 30 percent, reducing the length of hospital stays from 14.8 days

to 10.9 days, office visits by 10 percent, home visits by 65 percent, emergency room visits by 40 percent, and hospital admissions by 63 percent.¹²⁸

Examples of successful telemedicine programs for chronic diseases abound:

- A one-year study of 15 subjects with type 1 diabetes demonstrated significant improvements for patients using an insulin pump and a real-time continuous glucose monitoring system. Participants had three in-person medical visits and uploaded data daily. At the conclusion of the study, participants reported a significant improvement in quality of life and satisfaction with treatment.¹²⁹
- In a telemedicine-based care model for treatment of Parkinson's disease, 78 patients sent frequent video recordings (about three per day) from their homes to the treating team via the Internet. The videos were used to inform therapeutic decisions, including drug adjustments. At the conclusion of the month, the participants demonstrated significantly less impairment on a standard scale.¹³⁰
- A study of patients discharged with congestive heart failure and chronic obstructive pulmonary disease found that remote monitoring reduced hospital readmission rates by over 60 percent.¹³¹

Remote monitoring is especially helpful for the elderly, since approximately 84 percent of adults who are aged 65 or older suffer from at least one chronic condition.¹³² In the event that these individuals are eventually transferred to a nursing home, telemedicine continues to provide benefits by supplementing limited staff. The New England Health Institute reports that nursing home physicians spend on average less than two hours per week on site. Extended eVisit technologies allows for "around-the-clock" audio and videoconferencing consultations for nursing home residents who are unable to meet directly with their physicians. These

technologies can already benefit the 1.5 million Americans living in nursing homes. As the baby boomer generation ages, demands on limited nursing staff will only increase, providing greater need for remote monitoring technology.¹³³

The Carle Foundation Hospital and many of its affiliate clinics throughout the community are included in the UC2B fiber ring. The hospital is a 345-bed regional care facility, which provides critical services to patients from the surrounding communities.¹³⁴ According to the Carle Foundation Hospital's most recent annual report, the facility had 20,716 inpatient admissions—including 2,449 births; 61,583 emergency department patients; 909 trauma patients; 27,959 outpatient visits; and 12,905 outpatient/inpatient surgical patients in 2010. The hospital employs 5,783 individuals, with 300 physicians in the Carle Physician Group, an outpatient practice serving more than 200,000 patients annually.¹³⁵ While the hospital and its clinics are connected, many of its patients do not have high-speed broadband in their homes. This prevents patients from receiving remote care, leading to unnecessary hospital visits.

14. Gigabit Fiber Networks Offer Aging in Place and Other Supports for Seniors

High-speed broadband promises a range of applications that can benefit an aging population. In particular, broadband access can lower medical costs and prevent hospitalization through home-based monitoring; extend employment opportunities through telework; and foster ongoing relationships by allowing homebound seniors to connect to the outside world.¹³⁶ These benefits translate to dramatic savings in Medicaid and Medicare expenses for the federal and state government, reduced demand for limited space in local hospitals and long-term care facilities, and increased income and savings for residents.

Seniors are more likely to seek health information online if they have a dependable, high-speed broadband connection. Such access empowers seniors by allowing them “to be preemptive and interactive in their efforts to combat the harmful effects of aging.”¹³⁷ It also translates to reduced medical expenses. In fact, Kaiser Permanente found that allowing

enrollees (of all ages) to email questions to their doctor through a secure messaging system led to a 7 to 10 percent reduction in primary care visits.¹³⁸

Medical monitoring enabled by high-speed broadband may also delay and potentially eliminate the need for institutionalized living for senior citizens, with dramatic savings. As of 2002, 5 percent of Medicare-eligible seniors (1.6 million) lived in nursing homes.¹³⁹ This number is expected to increase as baby boomers retire and life-span increases. In fact, 44 percent of seniors will live in nursing homes at some point.¹⁴⁰ This care comes at a significant cost. In 2004, the federal government spent \$135 billion on long-term care for the elderly.¹⁴¹

At \$228 per day (\$83,297 annually) for a private room, nursing home costs in Champaign County are slightly lower than the national average (\$239 per day).¹⁴² Given that the average time a senior citizen will live in a nursing home is projected to be two and a half years, the total cost of the stay in Champaign County would be around \$208,242.

Assuming that 44 percent of Champaign County's senior citizens (who total 20,066 according to the latest census estimate¹⁴³) will live in nursing homes for that length of time, they will collectively pay more than \$1.8 billion for long-term care. If broadband-enabled health monitoring were able to reduce the average resident's length of stay in a nursing home by six months, residents would save more than \$368 million in nursing-home fees. (The normalized annual savings is a function of turnover of the seniors living in a nursing home.)

Admittedly, the savings in nursing-home expenses would be somewhat offset by the cost of additional at-home health care, but those fees are only a fraction of the daily cost of nursing-home care. Nationally, private at-home care is \$21 per hour.¹⁴⁴ With broadband in the homes of patients, medical monitoring could make it possible to need as little as one hour every day of in-home care. This approach also represents an improvement in the quality of life for seniors in addition to the obvious economic benefits of home-based care. Indeed, an AARP study found that 87 percent of seniors would prefer to have help provided to them in their homes rather than in an institution.¹⁴⁵
